

TaskFlow

Enterprise Task Management System

Project Submission Report

SUBMITTED GITHUB REPOSITORY:

<https://github.com/ROHAN-3105/Task-managament>

TECHNOLOGY STACK:

- Backend: Python Flask, MySQL Connector
- Frontend: HTML5, CSS3 (Custom Glassmorphism), Vanilla JavaScript, Chart.js
- Database: MySQL with relational schema and integrity constraints

Generated automatically on July 9, 2026

1. Secure Login & Authentication

TaskFlow features a secure, role-based login system. Users can authenticate as an Admin, Manager, or Employee. Passwords are securely hashed in the database using Werkzeug's security algorithm (scrypt/pbkdf2). The user interface leverages premium CSS variables, a customized glassmorphism theme, smooth animations, and interactive input elements.

Key Features Verified on this Screen:

- Dynamic dropdown to select User Role (Admin, Manager, Employee).
- Front-end validation coupled with backend verification and error messaging.
- Persistent session cookies and role-based redirecting logic.

2. Real-time Admin/Manager Dashboard

Upon successful authentication as an Admin, the system redirects to the real-time analytics dashboard. The dashboard integrates Chart.js dynamically rendering task distributions, employee workloads, and overall completion gauges. The layout is fully responsive, implementing CSS grids, custom cards, and hover effects.

Key Features Verified on this Screen:

- Real-time analytics counters showing Total Tasks, Pending Tasks, Completed Tasks, and Employees.
- Dynamic Chart.js visualizations tracking status distributions and employee loading.
- High-performance MySQL database queries executing aggregation operations instantly.
